Agroglyphes - are they natural or of artificial origin?  
They became very popular and many were later performed as sort of environmental art, mechanically. However, it occurs that the "original ones" were results of acting of... heat sources. Could they be result of solar IR radiation refraction in atmosphere? On some set of air lenses forming within atmosphere air of different density? On clouds, maybe?

Many states so, because there is no plain explanation.

Meteorologists excluded the likeness of arising them as a consequence of 'devil dust whirls of wind', as detailed research had shown that at least the "original ones" were results of acting of... heat sources.

In my opinion they could not necessarily be results of laser radiation of ET or landing of their UFOs.

They could be result of another new natural phenomenon. My hypothesis is that it can be effect of solar IR radiation refraction in atmosphere? On some set of air lenses forming within atmosphere air of different density? On specific isolated spherical clouds, maybe? During hot day, without wind, such cloud (or invisible air lens) can stay stationary even for an hour or so. If irradiation in such focus point is few or ten times higher than around, it may cause observed thermal destroying of key supporting parts of plants. Weakened they lay down at the slightest movement of wind (or even without it). Such a "stationary" cloud or lens while moving randomly can give sequential fractal images, also, especially in combination with an effect of sun apparent movement on the sky.

Devil dust on Mars - such a phenomenon was excluded as a reason of the unexplained agroglyphes.

They are man made (natural origin that would be, he, he).

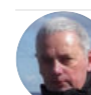

This is how they are made:

Nice artwork.

Yes, these specific clouds may be result of airborne particles of dust forming a lenses within an air. Gravity and thermal move of air in opposite directions can form almost perfect lenses in air. Diffraction and refraction could make all the rest.

Yes, Ales, many of later of them were mechanical imitations and/or even artistic expression. But some are not explained as it was proven they had arisen in effect of some thermal EM irradiation.

Dear [Aparna Sathya Murthy](#) , I am now seriously considering opening a new Working RG Project, concerning modelling of such phenomena. Your experience with image processing could be very useful here. If only you would like to take part in such (not too much intensive) research in some free time? (We all have not too much of this, so effects could not be immediate... though.)

Sure Prof [Zbigniew Motyka](#) , that would be interesting , nope not for the outcomes but the "devil" aspect of it ;)
